

Firenock Review update by Roger Peck, 5th October 2008
Firenock GS, S1

I just want to add this to my previous review of Sept 26, 2008.

I found it to be amazing and attests to the quality of FIRENICK. I killed a small buck the first day of archery season here in Virginia two days ago and had a firenock on the arrow. With the firenock which lit perfectly on the shot, I saw it disappear into the shoulder of the deer. I went to retrieve my arrow and I found the forward part of the shaft only with the broadhead. A small portion of the arrow (about 4 inches maybe) with the firenock and the fletching was missing. The deer only ran 20 yards before falling and when I went to retrieve him, I found the leg bone on the far side was shattered and ASSUMED that the small part of the arrow was in the deer, having been broken off as the arrow was slowed down by the fletching reaching the bone and the arrow was broken when the deer jumped to get away....or just moved the leg with the busted bone.

When I field dressed the deer, the chest cavity was FULL of blood and I found the small part of my arrow was buried in the "blood pool", and the FIRENOCK was still lit when I pulled the piece of arrow out of the blood. I tapped it on an old log, and it turned off. No blood had seeped in around the nock on the inside of the shaft,

and the "O" ring on the battery was just tight enough that none of the blood got past it from the broken end of the shaft onto the circuit board. I wiped the little bit of blood off the battery with a wet cloth, wiped it dry, put it into another arrow and fired it. The FIRENOCK lit perfectly and I now have the same one on my arrow for the NEXT deer!
